

MoonBit JSONPath

OSC2026 closeout report - ppyj663/moon-jsonpath

GitHub: github.com/ppyj663/moon-jsonpath GitLink: gitlink.org.cn/ppyj663/moon-jsonpath License: Apache-2.0

Project Scope

- A MoonBit library that parses JSONPath strings and evaluates them against moonbitlang/core/json values.
- v0.1.0 covers root, object child, bracket child, recursive descendant, wildcard, and array index selectors.
- Unsupported RFC 9535 areas are documented explicitly: filters, slices, unions, negative indices, and function extensions.

Engineering Evidence

- MoonBit metadata now uses module ppyj663/moon-jsonpath with repository, license, keywords, README, and description.
- Deprecated moon.mod.json and moon.pkg.json files were removed to avoid manifest ambiguity.
- A runnable example is available with moon run cmd/main and prints a real JSONPath query result.

Verification

- OK moon update
- OK moon fmt --check
- OK moon check --warn-list +73
- OK moon test
- OK moon run cmd/main
- OK git diff --check

Closeout Materials

- README documents installation, API, examples, supported syntax, limitations, tests, and CI.
- docs/competition/acceptance.md records repository links, acceptance checklist, commands, and maintenance notes.
- GitHub Actions CI validates the same MoonBit path on push and pull request.

Result

The project is packaged as a public, testable, documented MoonBit ecosystem library ready for OSC2026 acceptance review. Mooncakes publish target: ppyj663/moon-jsonpath, with ppyj663/jsonpath reserved as fallback only if hyphenated package names are rejected.
